Main Database
```

Explanation of Flow

Step 1 – Resume Upload Flow

- Candidate uploads resume (Frontend)
- Backend sends resume → **ATS AI**
- ATS AI extracts skills & experience
- Parsed data stored in **AI Storage**
- Backend saves structured profile in **Main Database**

Step 2 – Job Matching Flow

- Backend sends candidate skills + job skills → **Screening AI**
- AI calculates **Match Score**
- Result stored in **AI Storage**
- Backend updates application status in **Database**

Step 3 – Interview Processing Flow

- Interview video saved by Backend
- Backend sends processing request → **Queue**
- **Interview AI** analyses video & speech
- Scores stored in **AI Storage**
- Backend gets result via **Webhook**
- Final score stored in **Main Database**

Meaning of this Design (Very Important)

- Backend controls all AI communication
- AI Storage used for **temporary AI results / embeddings / logs**
- Main Database used for **final hiring data**
- Improves scalability & performance
